THEME 02

## Climate, Resource Infrastructure & Global Supply Resilience

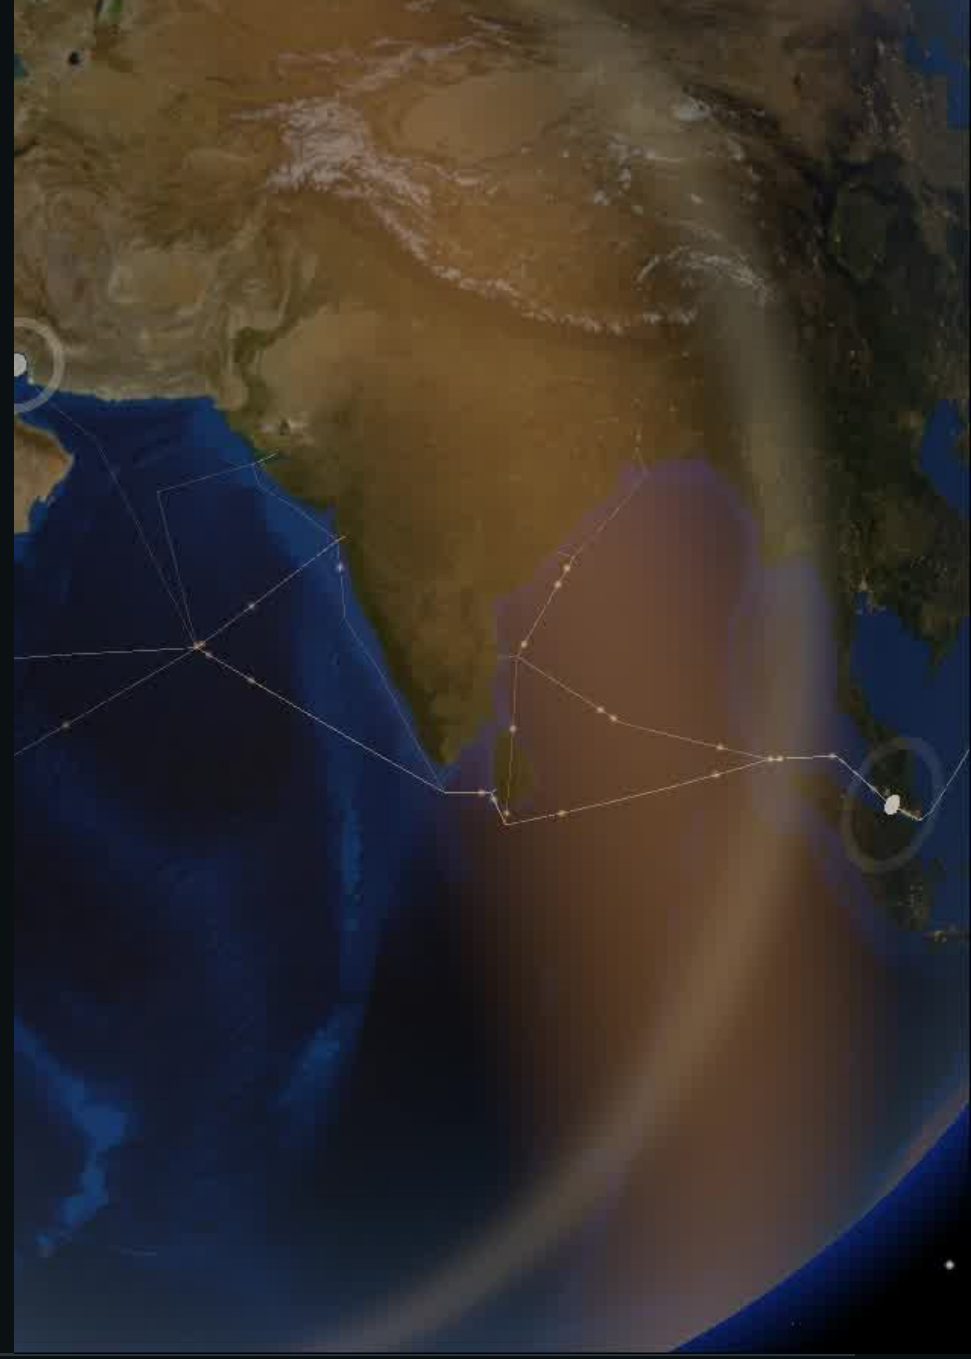

# DHRUVA

PROBLEM STATEMENT / SHOCKWAVE

A live supply-shock desk for India's small importers and exporters.

## TEAM ZORVIX

**ROHITH MS · SAKTHI P · PARTHASARATHY S**

# Public signals. No shipment-level answer.

For Indian MSME importers, exporters, small forwarders and procurement teams.

01

## Scattered public signals

Weather, cyclones, alerts and transport feeds live in different places, formats and timeframes.

02

## Risk crosses transport modes

A sea leg, airport transfer and road delivery have different exposures and blind spots.

03

## Advice stops before hand-over

The shipper still needs to select a nearby agency and review when and where to hand over.

**THE PS: TRANSLATE A SUPPLY SHOCK INTO WHAT IT MEANS FOR THIS CONSIGNMENT.**

# One desk, from description to hand-over.

A connected workflow across sea, air, rail and road.

01

## DESCRIBE

Pick places or type the shipment in a sentence.

›

02

## PLAN

Build candidate routes with real coordinates.

›

03

## CHECK

Read the sources relevant to each transport leg.

›

04

## DECIDE

Inspect risk, confidence and possible alternatives.

›

05

## HAND OVER

Find an agency, review details, create a signed slip.

### Real data

Missing sources stay visible.

### Inspectable reasoning

Verdicts cite evidence and freshness.

### A human decides

Approval precedes the booking slip.

# Eleven specialist roles. One checkable answer.

Next.js + React + TypeScript • NDJSON analysis stream • No database requirement

**UNDERSTAND**

- **Intake**
- **Planner**

Resolve the shipment and candidate itineraries.

**WATCH**

- **Maritime**
- **Storm**
- **Aviation**
- **Surface**
- **Alerts**
- **News**

Read source-specific evidence for the relevant legs.

**DECIDE**

- **Corroborator**

Deterministic code judges agreement and confidence.

**ACT**

- **Strategist**
- **Comms**

Compare alternatives and explain the next step.

**The language model can polish parsing and prose. It does not invent the risk score.**

# Every signal carries its receipt.

The desk reports where a reading came from, when it was fetched and what it can cover.

**Sea**

IMF PortWatch • Open-Meteo Marine

**Weather + hazards**

Open-Meteo • GDACS • USGS

**Official + aviation**

NDMA Sachet • AviationWeather • FAA NAS

**Routes + agencies**

OSRM • OpenStreetMap / Overpass / Nominatim

## Confidence needs corroboration.

Independent evidence matters. Stale and unavailable feeds reduce coverage and certainty.

GREEN WATCH RED

No fresh evidence → “Unsure”.

# Indore → Chennai: the evidence changes the plan.

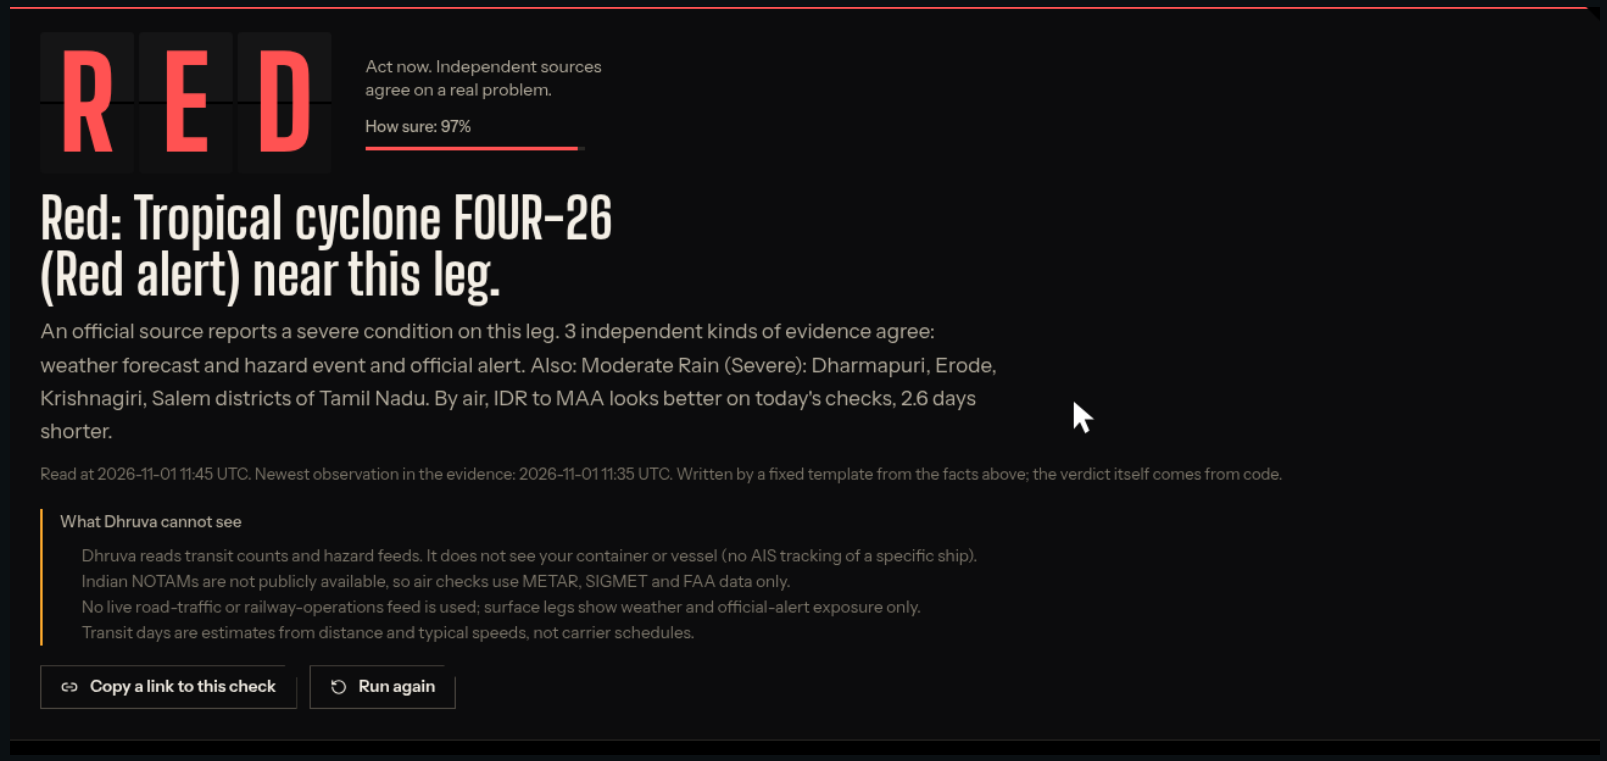

Road shipment • 20 kg of textile samples • Actual project output captured during the demo

## RED

### 97% confidence

**1,447 km • about 3.6 days**

Cyclone + severe rain evidence
Three independent families:
weather, hazard, official alerts.

DATED DEMO SNAPSHOT — not a current travel advisory or a promise of safe passage.

# Carry the reviewed decision to the counter.

Find nearby agencies, compare their fit and approve a hand-over plan.

**01 Find near the origin**

Actual Indore post-office and courier listings.

**02 Review the fit**

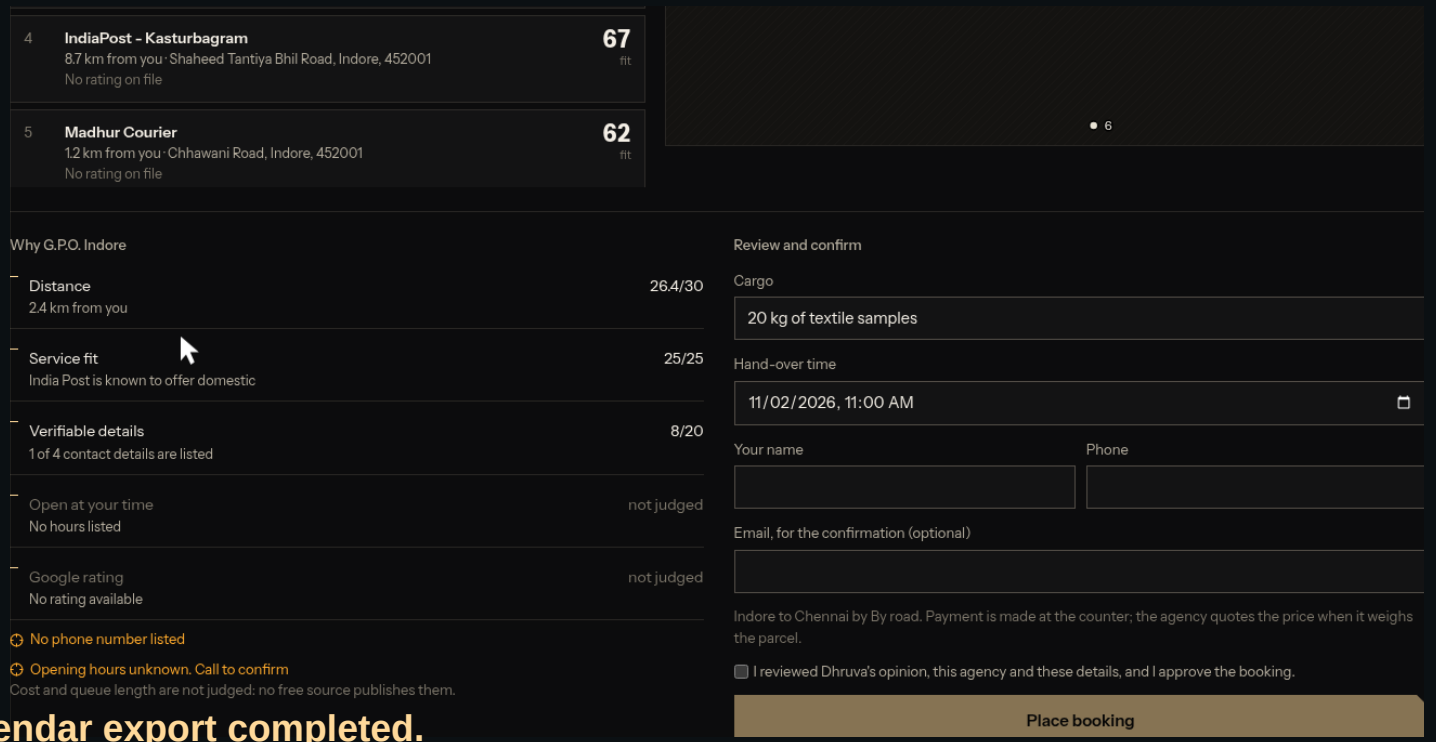

Distance, capabilities and known details.

**03 Approve the details**

Cargo, sender and proposed hand-over time.

**04 Keep the signed slip**

Shipment + selected agency + risk snapshot.

**Demo selection: G.P.O. Indore. Signed slip + calendar export completed.**

The slip records the approved plan; it does not automatically reserve a carrier slot or notify the agency.

# Make the next shipment an informed decision.

## IMPLEMENTED TODAY

Multimodal route planning
Source-linked risk explanations
Freshness and confidence visibility
Nearby agency + signed hand-over slip

## PROPOSED NEXT STEPS

Document-photo intake from the proposal
Deeper operational feeds and monitoring
Carrier integrations for confirmed slots
MSME pilots and outcome validation

---
